SECURITY AND GOVERNANCE IN ZOHO CREATOR

Aim

To implement security and governance in a Zoho Creator application by configuring user permissions, access controls, data protection, and application-level security policies to ensure that data is accessed and managed securely.

System Prerequisites & Platform Components

- **Platform:** Zoho Creator Web Enterprise Console
- **Modules Configured:** Users & Permissions, Module/Form Permissions, Role-Based Access Control (RBAC), Audit Trails, Data Encryption Rules

Security Controls Overview

Security Control	Application Point	Risk / Vulnerability Mitigated
Role-Based Access Control (RBAC)	Forms, Reports, & Modules	Unauthorized record modification and feature access
Field-Level Security	Sensitive Data Fields	Exposure of PII and confidential operational details
Data Validation Rules	Form Field Properties	Data corruption and invalid record creation
Audit Log & Activity Tracking	Governance Settings	Non-repudiation and tracking unauthorized change attempts

Procedure

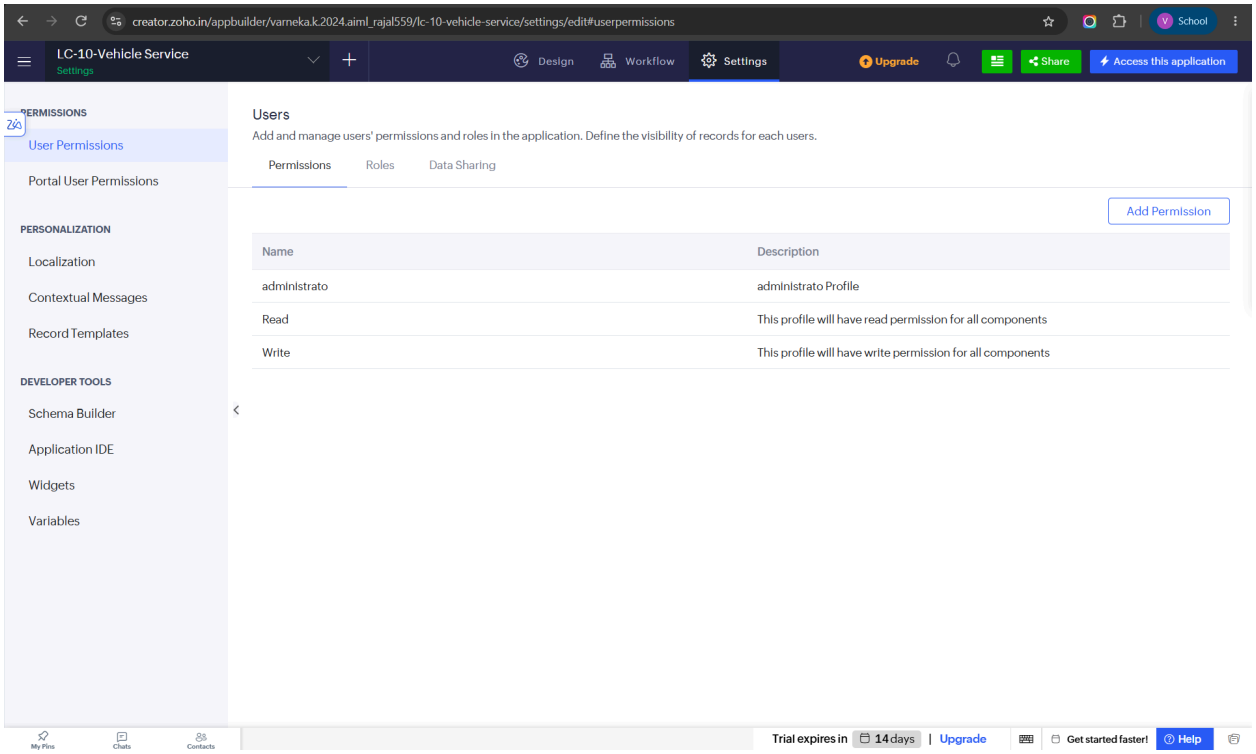

1. **Navigate to Settings:** Open the target application in Zoho Creator and access the **Application Settings** section.
2. **Configure User Access:** Navigate to **Users & Permissions** and add authorized users by assigning distinct predefined or custom roles (e.g., Administrator, Manager, Front Office Staff, Technician) based on their operational responsibilities.
3. **Set Component Permissions:** Configure explicit access controls for application components including forms, reports, custom pages, and buttons to enforce principle of least privilege.
4. **Implement Role-Based Access Control (RBAC):** Restrict permission sets to govern specific user capabilities (View, Create, Edit, Delete) across application records.
5. **Protect Sensitive Data:** Identify confidential fields (such as contact numbers, payment details, or proprietary notes) and enforce field-level security and encryption where supported.
6. **Apply Data Validation Rules:** Enforce mandatory field properties, regex input validation, and dynamic field visibility rules to ensure data integrity prior to form submission.
7. **Audit Workflows & Deluge Scripts:** Review background automated workflows and Deluge scripts to confirm execute privileges operate securely without exposing data or API keys.
8. **Manage Sharing & Portals:** Manage application-sharing links and customer/vendor portal credentials, revoking stale access periodically.
9. **Test Security Configuration:** Log in using test accounts corresponding to each configured user role to confirm that unauthorized fields, forms, and actions are properly restricted.
10. **Monitor Governance Settings:** Access governance settings, audit trails, and system logs regularly to track active user actions, maintain compliance, and optimize system usage limits.

Implementation Matrix

User Role	View Rights	Edit / Add Rights	Delete Rights	Special Restrictions
Administrator	All Application Records	All Modules & System Settings	Full Permitted	Unrestricted system configuration
Operational Staff	Assigned Department Records	Create & Update Active Records	Restricted	Restricted from system settings & export
Standard User / Portal User	Own Submitted Records	Create New Requests	Disabled	Read-only view for restricted forms

Result

Security and governance measures were successfully configured in Zoho Creator by managing user roles, controlling access to application components, protecting sensitive data, and validating user permissions. These controls prevent unauthorized access, maintain overall data integrity, and ensure compliant application governance.
